1. What is a key step in setting up a dataset class for an unlabeled dataset in unsupervised learning?

1 / 1 point

- (●) Defining how to load and preprocess the data
- ( ) Ensuring all data is labeled
- ( ) Removing all non-numeric features
- ( ) Using only a small subset of the data

Correct
Correct! Loading and preprocessing data is crucial for model training.

2. Which of the following techniques can be used to apply sentiment analysis models to different languages using pretrained models?

1 / 1 point

- [ ] Training a separate model for each language from scratch
- [ ] Manually parsing text and building language-specific rules
- [x] Fine-tuning a pretrained model on a multilingual dataset

Correct
Correct! Fine-tuning a pretrained model on a multilingual dataset can also be effective for sentiment analysis in different languages.

- [x] Using multilingual BERT models

Correct
Correct! Multilingual BERT models can handle multiple languages for sentiment analysis.

- [x] Using translation APIs to convert text into a single language

Correct
Correct! Translation APIs can help convert text into a single language, allowing the use of pretrained models.

3. What is a key benefit of using pretrained models from the Transformers package?

1 / 1 point

- ( ) They require a large amount of labeled data to be effective.
- ( ) They are optimized for running on mobile devices.
- (●) They can achieve high performance on NLP tasks without the need for extensive retraining.
- ( ) They are specifically designed for image processing tasks.

Correct
Correct! Pretrained models from the Transformers package can achieve high performance on NLP tasks with minimal retraining.

4. Which of the following steps is necessary to access and extract word embeddings from GloVe models?

1 / 1 point

- ( ) Train a neural network to generate embeddings from the GloVe model.
- (●) Download the GloVe model files and load them into your program.
- ( ) Use a GPU to accelerate the extraction of embeddings.
- ( ) Convert GloVe embeddings to Word2Vec format before use.

Correct
Correct! You need to download the GloVe model files and then load them into your program to access word embeddings.

5. Which steps are involved in implementing an extreme learning machine?

1 / 1 point

- [ ] Train the hidden layer weights using backpropagation.
- [x] Randomly initialize the weights between the input and hidden layers.

Correct
Correct! One of the unique aspects of extreme learning machines is the random initialization of weights.

- [ ] Iteratively update the weights using gradient descent.
- [x] Compute the output weights analytically in a single step.

Correct
Correct! The output weights are computed in a single step using a closed-form solution.
