Your latest: **100%** • Your highest: **100%** • To pass you need at least 80%. We keep your highest score.

1. In the chapter by Pretz et al., there is a discussion of “well-defined” versus “ill-defined” problems. Which of the following is true of ill-defined problems? **1 / 1 point**

- (●) Ill-defined problems generally don't lend themselves to “problem-space” representation.
- ( ) Ill-defined problems always have a clear and correct solution.
- ( ) Ill-defined problems tend not to be important.
- ( ) Ill-defined problems can be solved by well-understood search algorithms.

✓ **Correct**

2. The Chase-Simon “chess memory” experiment illustrates which of the following ideas? **1 / 1 point**

- ( ) Experts in a domain like chess have far better memory for all sorts of things than do chess novices.
- ( ) There are no measurable differences of any kinds between chess experts and chess novices.
- ( ) Chess experts are likely to be better than chess novices at solving problems in other domains (like physics or math).
- (●) Chess experts internally represent chess games differently than do novices, and thus have better memory for realistic chess board positions than do novices.

✓ **Correct**

3. Suppose we have a problem space representation in which the (lone) goal state can be reached via a sequence of edges from some states but not others. Which of the following statements is true of this problem (and its graph)? **1 / 1 point**

- ( ) This is an ill-defined problem.
- (●) As long as our start state is among the states with paths to the goal state, then we can consider this problem solvable.
- ( ) As long as our start state is among the states with paths to the goal state, then we can consider this problem easy.
- ( ) The number of “good” start states will always be fewer than the number of “bad” (no available path) start states.

✓ **Correct**

4. Which of the following best describes (on the basis of experimental evidence) people's use of logical reasoning? **1 / 1 point**

- ( ) People can and do use logic extensively in their everyday reasoning.
- (●) People are capable of reasoning logically, but it takes effort and they do so inconsistently (depending on context) in everyday situations.
- ( ) People are hopelessly incapable of reasoning logically.
- ( ) People can reason logically, but only if they are urged to do so consciously.

✓ **Correct**
