Module 6 Summary

After completing all of the materials, please take a moment to reflect on what was covered. The learning objectives below capture the key takeaways from this module:

- Understand the role of numerical integration in Bayesian computation.
- Learn about distributional approximations and their applications.
- Learn about various posterior simulation techniques.
- Understand and apply direct simulation, rejection sampling, and importance sampling.
- Understand the principles of Markov chain simulation.
- Learn and apply the Gibbs sampler, Metropolis algorithm, and Metropolis-Hasting algorithm.
- Explore debugging techniques in Bayesian computing.
