Instructions

1. What is a key characteristic of an additive model in statistics? **1 / 1 point**

- ○ It requires that all predictors be transformed into binary variables.
- ◉ It assumes that the effect of predictors on the response is additive.
- ○ It uses only one predictor variable.
- ○ It multiplies the effects of different predictors to estimate the response.

Correct
Correct! Additive models assume that the total effect is the sum of the effects of individual predictors.

2. In the context of machine learning, what is a decision tree model? **1 / 1 point**

- ○ A model that visualizes the decision-making process of neural networks.
- ◉ A tree-like model used to make decisions or predictions based on rules inferred from the data.
- ○ A linear model that prioritizes decisions based on a tree structure.
- ○ A model that can only classify data into two categories.

Correct
Correct! Decision trees make predictions based on a series of decision rules derived from the data.
