Discussions (/learn/analytics-excel/peer/sDcrc/part-5-modeling-credit-card-default-risk-and-customer-profitability/discussions)

Instructions

Learners will provide conclusions and discussion about their outcomes from the detailed problems they have completed in the Final Project Quizzes.

Instructions

less ^

Referring back to the basic scenario and premise from the Final Project Quizzes, please complete the following questions on the My Submission tab:

1. What was the binary classification model you developed in Final Project Quiz 1, Question #1?
2. At the threshold score for the training set, what is the cost per event on the test set (from Final Project Quiz 1, Question #6)?
3. Your boss asks you to recommend a standard procedure for selecting future credit card applicants. Based on internal data alone (not using the Eggertopia scores) and the test set performance of your two models (the binary classification model from Final Project Quiz 1 and the linear regression model from Final Project Quiz 4), which method would you recommend - binary classification, linear regression or some combination or modification of the two? Explain why you recommended what you did, referencing at least two topics/points from the course.

Review Criteria

less ^

You will be asked to provide feedback to your peers in the following areas:

- Does the submitted model include at least 2 of the 6 pieces of data about the credit card applicants (age, years at current employer, years at current address, income over the past year, current credit card debt, and current automobile debt)? (2 pts)
- Is the minimum cost per event an acceptable cost per event? (3 pts).
- Does the learner provide a clear recommendation for which model (or combinations of models) to use to select future credit card applicants? (2 pts).
- Does the learner provide an explanation for their choice which references at least two topics/points from the course? (3 pts).
