

exercise2.py x

1# parent class

2class Book:

3 def __init__(self, title, author, genre):

4 self.title = title

5 self.author = author

6 self.genre = genre

7

8# child class

9class BlogPost(Book):

10 def __init__(self, website, title, author, word_count, genre, page_views):

11 super().__init__(title, author, genre)

12 self.website = website

13 self.word_count = word_count

14 self.page_views = page_views

15

16my_post = BlogPost("Vogue", "Hot Summer Trends", "Amy Gutierrez", 2319, "fashion", 2748)

17print(my_post.website)

18print(my_post.title)

19print(my_post.author)

20print(my_post.word_count)

21print(my_post.genre)

22print(my_post.page_views)

Inheritance Exercise 2

Exercise 2

Use the parent class `Book` to help you solve this problem. Create the child class `BlogPost` and override the constructor so that the child class has the following attributes:

- `website` - a string that represents the website hosting the blog post
- `title` - a string that represents the title of the blog post
- `author` - a string that represents the author of the blog post
- `word_count` - an integer that represents the number of words in the blog post
- `genre` - a string that represents the genre of the blog post
- `page_views` - an integer that represents the page views for the blog post

Expected Output

The table below shows the expected output for the indicated instantiation. Use the `TRY IT` button below and verify that your child class works as expected.

Object Instantiation	Print Statement	Output
my_post = BlogPost("Vogue", "Hot Summer Trends", "Amy Gutierrez", 2319, "fashion", 2748)	print(my_post.website)	Vogue
	print(my_post.title)	Hot Summer Trends
	print(my_post.author)	Amy Gutierrez
	print(my_post.word_count)	2139
	print(my_post.genre)	fashion
	print(my_post.page_views)	2748

TRY IT

Vogue

Hot Summer Trends

Amy Gutierrez

2319

fashion

2748

Submit your work when ready

Here is one possible solution:

```
# parent class
class Book:
    def __init__(self, title, author, pages, genre):
        self.title = title
        self.author = author
        self.genre = genre

# child class
class BlogPost(Book):
    def __init__(self, website, title, author, word_count, genre, page_views):
        super().__init__(title, author, genre)
        self.website = website
        self.word_count = word_count
        self.page_views = page_views
```

Check It!
