

exercise2.pyx

```
1 class Artist:
2
3     def __init__(self, name, medium, style, famous_artwork):
4         self.__name = name
5         self.__medium = medium
6         self.__style = style
7         self.__famous_artwork = famous_artwork
8
9
10 my_artist = Artist('Bill Watterson', 'ink and paper', 'cartoons', 'Calvin and Hobbes')
11 #print(my_artist.__name)
12 print(my_artist._Artist__name)
13 print(my_artist._Artist__medium)
14 print(my_artist._Artist__style)
15 print(my_artist._Artist__famous_artwork)
```

Encapsulation Exercise 2

Exercise 2

Define the `Artist` class which has attributes for `name`, `medium`, `style`, and `famous_artwork`. Do **not** use the Python convention to make these attributes.

Expected Output

Initialize an object of the `Artist` class as follows:

```
my_artist = Artist('Bill Watterson', 'ink and paper', 'cartoons', 'Calvin and Hobbes')
```

Task	Output
Print the name attribute	Error Message
Print the medium attribute	Error Message
Print the style attribute	Error Message
Print the famous artwork attribute	Error Message
Print <code>_Artist__name</code>	Bill Watterson
Print <code>_Artist__medium</code>	ink and paper
Print <code>_Artist__style</code>	cartoons
Print <code>_Artist__famous_artwork</code>	Calvin and Hobbes

Important

You do not need to create any getters or setters; do **not** follow the Python convention for private attributes.

TRY IT

Bill Watterson
ink and paper
cartoons
Calvin and Hobbes

Submit your code when ready.

Here is the solution:

```
class Artist:
    def __init__(self, name, medium, style, famous_artwork):
        self.__name = name
        self.__medium = medium
        self.__style = style
        self.__famous_artwork = famous_artwork
```

The line of code `_Artist__name` represents the output of name mangling. This happens when the double leading underscore is used in the attribute name. Trying to reference the `.__name` attribute will cause an error since the attribute name because `_Artist__name`.

Check It!
