

exercise1.py

```
1 import random
2
3 class Lottery:
4     def shuffle(self):
5         results = []
6         for i in range(5):
7             results.append(random.randint(1, 20))
8         return results
9
10 class PowerBall(Lottery):
11     def shuffle(self):
12         results = []
13         for i in range(6):
14             results.append(random.randint(1, 99))
15         return results
```

Polymorphism Exercise 1

Exercise 1

Use the `Lottery` class to the left as the parent class. Create the `PowerBall` class as a child class of `Lottery`. Override the `shuffle` method so that it returns a list of six random integers between 1 and 99.

TRY IT

Command was successfully executed.

Submit your code for evaluation

Here is one possible solution:

```
import random

class Lottery:
    def shuffle(self):
        results = []
        for i in range(5):
            results.append(random.randint(1,
            return results

class PowerBall(Lottery):
    def shuffle(self):
        results = []
        for i in range(6):
            results.append(random.randint(1,
            return results
```

Check It!
