⚙️

The following article explores the use of multiple linear regression to predict rainfall, a critical task for agricultural planning and disaster preparedness. The study is motivated by recent extreme weather events, such as the devastating floods in Kerala in August 2018, which highlighted the importance of accurate climate predictions. Focusing on data from Nellore district in Andhra Pradesh, India, the authors demonstrate that multiple linear regression provides more accurate rainfall predictions compared to simple linear regression. This improved accuracy can help farmers make informed decisions and better prepare for potential floods or droughts.
