

Mobile phone

You can use any smartphone with a modern browser as a fully-supported client for Edge Impulse. You'll be able to sample raw data (from the accelerometer, microphone and camera), build models, and deploy machine learning models directly from the studio. Your phone will behave like any other device, and data and models that you create using your mobile phone can also be deployed to embedded devices.

The mobile client is open source and hosted on GitHub: [edgeimpulse/mobile-client](https://github.com/edgeimpulse/mobile-client). As there are thousands of different phones and operating system versions we'd love to hear from you there if something is amiss.

There's also a video version of this tutorial:

Machine Learning Using Your Mobile Phone with Edge Impulse

Connecting to Edge Impulse

To connect your mobile phone to Edge Impulse, go to the [your Edge Impulse project](#), and head to the **Devices** page. Then click **Connect a new device**.

These are devices that are connected to the [Edge Impulse remote management API](#), or have posted data to the [ingestion SDK](#).

No devices connected yet.

[🔗 Learn how to connect a new device](#)

Devices page in the studio

Select **Mobile phone**, and a QR code will appear. Either scan the QR code with the camera of your phone - many phones will automatically recognize the code and offer to open a browser window - or click on the link above the QR code to open the mobile client.

Scanning a QR code to connect your phone to Edge Impulse

This opens the mobile client, and registers the device directly. On your phone you see a *Connected* message.

Data collection

Connected as phone_k8jwm4h4

You can collect data from this device from the **Data acquisition** page in the Edge Impulse studio.

Switch to classification mode

⌄ This client is [open source](#).

Connected message in the mobile client

That's all! Your device is now connected to Edge Impulse. If you return to the **Devices** page in the studio, your phone now shows as connected. You can change the name of your device by clicking on ⋮.

DEVICES (MOBILE CLIENT)

Jan Jongboom

Your devices

+ Connect a new device

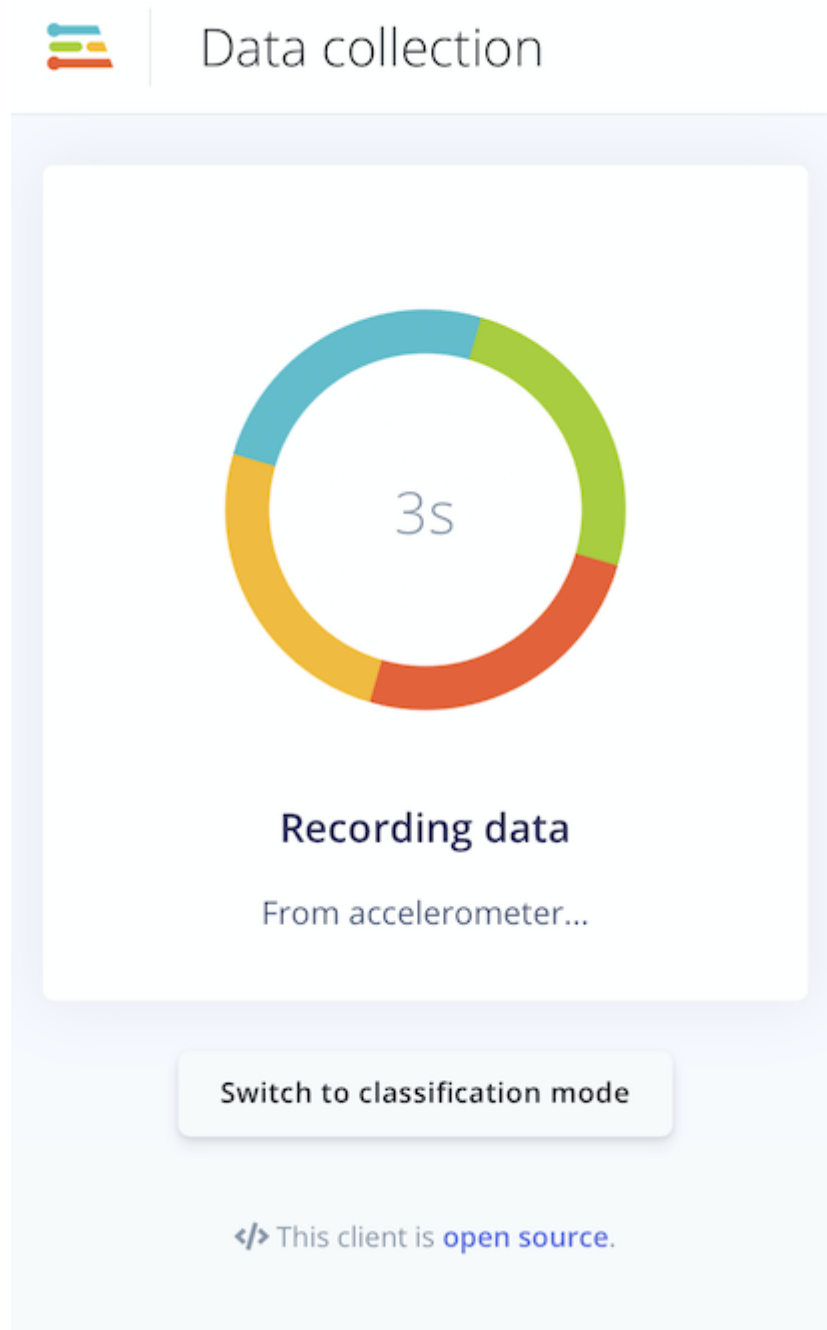

These are devices that are connected to the [Edge Impulse remote management API](#), or have posted data to the [ingestion SDK](#).

NAME	ID	TYPE	SENSORS	REM...	LAST SEEN	
 Jan's iPhone	PHONE_K8JWM4H4	MOBILE_CLIENT	Accelerometer, Microp...	●	Today, 10:06:18	⋮

Devices page showing a mobile phone as a connected device

- [Recognizing sounds from audio.](#)
- [Responding to your voice.](#)
- [Adding sight to your sensors.](#)

Your phone will show up like any other device in Edge Impulse, and will automatically ask permission to use sensors.

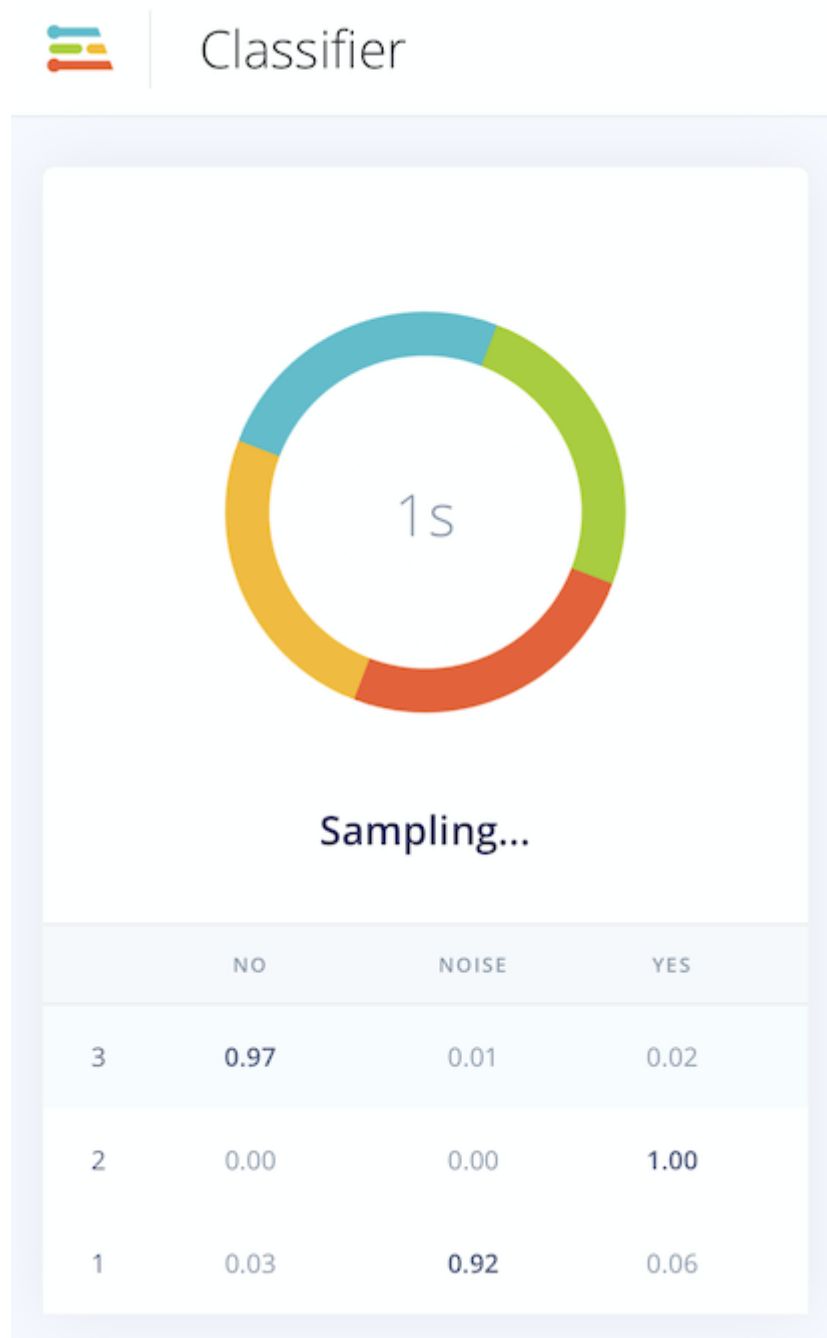

Sampling data from the accelerometer on a phone

No data (using Chrome on Android)?

You might need to enable motion sensors in the Chrome settings via **Settings > Site settings > Motion sensors**.

Deploying back to device

To do so, just click **Switch to classification mode** at the bottom of the mobile client. This will first build the impulse, and then samples data from the sensor, run the signal processing code, and then classify the data:

Running the mobile classifier on a keyword spotting model

Victory! You're now running your machine learning model locally in your browser - you can even turn on airplane mode and the model will continue running. You can also [download the WebAssembly](#) package to include in your own website or Node.js application. 🚀
