

Problem 4.13 - October 02, 2023

JD John W. Daily Verified Instructor

a year ago

Consider the energy levels of a hydrogenic atom for which $n=3$. In terms of appropriate quantum number values, list the different eigenstates, first assuming no spin-orbit coupling and then with spin-orbit coupling. Compare the degeneracies for the two cases (including electron spin) and sketch the component levels that result from spin-orbit coupling. Use Fig. 4.13 as a guide.

Good Morning,

An sketch is provided below for solution of problem 4.13

Kind Regards
