- ☐ in fact they could be the same; there is no need to two separate sets of data
- ☐ provided the number of testing pixels is much larger than the set of training pixels it doesn't matter how they are related.
- ☒ they shouldn't be related; both sets should be a set of randomly selected samples from each class

☒ **Correct**
That is correct. A true test of classifier performance requires data that is independent of the set used to train the classifier.
