1. You want to create a hybrid recommendation system to suggest music for new users on your music streaming app that just launched. New users are asked to rate a few bands they like. You have reliable data for artist name, song name, album name, etc. Each song is labeled for genre at a coarse level (rock, pop, etc.). Which component of your recommendation system will likely perform the best? 1 / 1 point
- ☐ The content-based component.

☐ The collaborative filtering component.

☒ The knowledge-based component.
- ✔ Correct

This answer is correct! Because the user has entered some basic preferences, and because we have reliable metadata for each song, we can recommend songs with the same metadata or allow users to find such songs on their own.
