2.1 Overview of Camera Calibration Self-Check Quiz

Next item →

1. What are the examples of internal parameters?

1 / 1 point

☐ Focal length

☐ Aperture

☐ Resolution

☒ All of the above

cooch

Ready to review what you've learned before starting the assignment? I'm here to help.

[Help me practice](#) [Let's chat](#)

Correct

Internal parameters of a camera include general internal characteristics that are essential for the camera calibration process. These parameters determine how the camera projects 3D world points onto the 2D image plane.

2. External parameters are the parameters that uniquely identify the transformation between the unknown camera reference frame and the world reference frame. True or False.

1 / 1 point

☒ True

☐ False

100%

10 points you need at least 80%. We keep your highest score.

Correct

External parameters in camera calibration represent the transformation between the camera's reference frame and the world reference frame. They provide information about the camera's position and orientation in the 3D world, allowing us to relate the camera's viewpoint to the external environment. By estimating the external parameters, we can determine where the camera is located and how it is oriented relative to the objects or points in the scene.
