1. What role do feature points play in the Structure from Motion process?

1 / 1 point

- ☐ They determine the camera settings
- ☐ They represent the 3D structure of the scene.
- ☒ They serve as reference points for matching between images.
- ☐ They control the lighting conditions in images.

 **Correct**

Feature points are distinctive and easily recognizable points in these images. They serve as reference points for matching between images. By identifying the same feature point in multiple images, SfM algorithms can determine how these images relate to each other.

2. What are the typical sequential steps involved in the Structure from Motion (SfM) process?

1 / 1 point

- ☐ Camera calibration, image acquisition, and depth estimation.
- ☐ Image preprocessing, object recognition, and 3D rendering.
- ☒ Feature detection and matching, camera pose estimation, and 3D point cloud reconstruction.
- ☐ Image compression, motion tracking, and 2D object localization.

 **Correct**

The typical steps in the SfM process involve detecting and matching features in images, estimating camera poses (camera motion and orientation), and reconstructing the 3D point cloud of the scene from the matched features. These steps are fundamental to the SfM pipeline.
