Here we realize that we are going to only get one URL. We are going to change our code to view more of the response data.

image_url = response['data']
print(image_url)

TRY IT!

```

Here we can see we got 3 URLs generated. What we are going to do is pull the different URL into separate variables and generate files to save the URL. To make our life easier we should have the following:

image_url1 = response['data'][0]['url']
image_url2 = response['data'][1]['url']
image_url3 = response['data'][2]['url']

TRY IT!

```
print(image_url1[0:15])
print(image_url2[0:15])
print(image_url3[0:15])
```

TRY IT!

We are slicing the content of our print statements here because we are generating URLs. The URLs tend to be in a longer format, because of that slicing might make the result more pleasing to the eye since we are just checking.

Fill in the blank with the right answer:

To access the second image URL from the response, use the following code: `response['data'][1]['url']`

The response `['data']` is a list containing information about the generated images. Since Python lists are zero-indexed, to access the second image URL, you should use `response['data'][1]['url']`.

Check It!
