Coding Exercise

Generate Image with GPT and DALL-E API

Objective: Write a Python function `generate_image(prompt)` that uses OpenAI's GPT API to enhance a user's text prompt and DALL-E API to generate an image based on that enhanced text, then saves this image as `my_img.png`.

Function Requirements:

Your function `generate_image(prompt)` should accomplish the following steps:

- 1. Accept a user's prompt as an argument.
- 2. Refine this prompt by passing it to the GPT API.
- 3. Generate an image from the refined prompt using the DALL-E API.
- 4. Save the generated image as `my_img.png`.

Your Python function must look like the template below:

```
def generate_image(prompt):
    """
    This function accepts a user's prompt, enhances it using the GPT API, then
    generates an image using the DALL-E API and saves it as my_img.png.

    Parameters:
        prompt (str): The initial user's prompt.

    Returns:
        None

    """

    # Step 1: Pass the user's prompt to the GPT API to get a refined prompt.

    # Step 2: Pass the refined prompt to the DALL-E API to get the generated image.

    # Step 3: Save the generated image as `my_img.png`.

    return None
```
