ChatGPT API Usage

As more applications incorporate the ChatGPT API by OpenAI, it becomes increasingly important to monitor and analyze API usage and performance to ensure optimal functionality and user experience. We are going to cover various tools and strategies for monitoring and analyzing the ChatGPT API, including using monitoring tools, analyzing data, and troubleshooting common issues.

To begin, let's look at an example of how to make an API call to the ChatGPT API using Python. For this example, we will use the "completion" feature of the ChatGPT API, which allows us to generate text based on a given prompt.

```
response=openai.ChatCompletion.create(
    model="gpt-3.5-turbo",
    messages=[
        {"role": "system", "content": "You are a helpful assistant."},
        {"role": "user", "content": "What's a good book to read on a rainy day? please just name 2."},
    ],
    n=3
)

for i in (response["choices"]):
    print(i["message"]["content"].strip())
    print("//////////")
```

TRY IT!

Two fantastic books to read on a rainy day are "The Nightingale" by Kristin Hannah and "The Secret History" by Donna Tartt.

//////////

Two great books to read on a rainy day are "Pride and Prejudice" by Jane Austen and "The Catcher in the Rye" by J.D. Salinger. These classics provide engaging stories and memorable characters that are perfect for cozying up with on a rainy day.

//////////

Two recommended books to read on a rainy day are:

- "The Nightingale" by Kristin Hannah: This historical fiction novel explores the lives of two sisters in war-torn France during World War II. It is a gripping and emotional story filled with courage, resilience, and the power of love.
- "Harry Potter and the Sorcerer's Stone" by J.K. Rowling: This iconic fantasy novel introduces readers to the magical world of Hogwarts, following the journey of an orphaned boy named Harry Potter. It is a perfect choice for a cozy rainy day, as it will transport you into a world of adventure, friendship, and endless magic.

//////////

First of all we could use can use `openai.Completion.create` instead of `openai.ChatCompletion.create`. `openai.Completion.create` is used for generating text completions without a conversational context, while `openai.ChatCompletion.create` is used specifically for generating responses in a conversational context, making it easier to build chatbots and other conversational applications.

Let's quickly go over what the code does. The first import the necessary libraries (os, openai, and secret) and set the API key for the openai library using a separate file (secret.api_key contains the actual key).

We print the response from the ChatGPT API using a for loop to iterate over the choices list in the response object. Each choice object contains a text attribute, which contains the generated text from the ChatGPT API. We use the strip() method to remove any extra whitespace and add a separator (`//////////`) between each generated response.

What is the difference between using

`openai.Completion.create` and `openai.ChatCompletion.create`?

- ☐ There is no difference; both methods can be used interchangeably.
- ☒ `openai.Completion.create` is used for generating text completions without a conversational context, while `openai.ChatCompletion.create` is used specifically for generating responses in a conversational context.
- ☐ `openai.ChatCompletion.create` is used for generating text completions without a conversational context, while `openai.Completion.create` is used specifically for generating responses in a conversational context

`openai.Completion.create` is used for generating text completions without a conversational context, while `openai.ChatCompletion.create` is used specifically for generating responses in a conversational context, making it easier to build chatbots and other conversational applications.
