Code Generation and Translation

We tend to think about GPT-3 text generation abilities as being related to human languages. However, it can also work with programming languages. In the example below, the model can reason about a given code sample and determine the end result.

what is the result of the following code?
x = 3
print(x ** 2)

generate python code to sort an unsorted list

TRY IT!

Command was successfully executed.

RESET

Command was successfully executed.

Because GPT-3 can reason about code, then it should be able to find bugs in the code.

Fix bugs in the python function

Buggy Python
import Random
a = "12"
b = random.randint(1,12)
add(a,b)

TRY IT!

Command was successfully executed.

RESET

Command was successfully executed.

We can use it to explain a piece of Python code in human language.

explain the following code
import Random
a = "12"
b = random.randint(1,12)
add(a,b)

TRY IT!

RESET

More examples can be found in the OpenAI website.

GPT-3 code writing

Which of the following tasks related to coding can readily be performed by GPT-3?

☐ Identifying the root cause of a server error

☐ Generating complex algorithms for data analysis

☒ Automatically translating written code into different programming languages

☐ Predicting future trends in software development

The correct answer would be "Automatically translating written code into different programming languages", as GPT-3 can generate code in different programming languages. This question tests the learners's understanding of the information you provided about GPT-3's capabilities related to coding, and requires them to differentiate between different tasks that may or may not be within the realm of what GPT-3 can easily do.
