Part 1. Box Creation

We are going to create a Python function that asks the user for some information. We will use the information given by the user to create our program.

We will be interacting with user input we are going to use the terminal to interact with our program. The Try It button below will run your code inside the terminal .

First, let's create a function that takes a list of movies and put it in a nice box. As we don't have our movie list yet, we are going to create a sample list. Copy and paste the following inside our `moflix.py`

```
sample=["One life","Two","Potato Pie and Life"]
print(sample)
```

TRY IT!

We are going to create a function that takes an argument which is our movie list. That function should return the movie list in a nice box.

Our box should change based on the number of movies and the length of the items that need to fit in the box. We are going to create our function called `InBox` that first tries to get the length of the biggest element in our list.

```
def InBox(x):
    #this gives you the longest string
    biggest = max(x, key = len)
    #THIS gets you the length of the biggest string
    biggest=len(biggest)
```

TRY IT!

Nothing should generate, this is a test that we don't have any errors so far.

Now for the top of our box we are going to start and end with `+`. Then for the content in the middle we will fill it with `-`. This technique will be used for both our top and bottom.

```
print("+" + "-" * (biggest + 2) + "+")
```

TRY IT!

To try it, use the sample provided above `sample=["One life","Two","Potato Pie and Life"]` and call the function: `InBox(sample)` .

We want to focus on the middle part now. We will use a for loop to iterate through all our items. We'll start off with a `|` and then add our movie title. We'll then add additional whitespaces `" "` to match the length of the longest element.

```
for i in x:
    print("| " + i + (" "*(biggest-len(i))) + " |")
```

TRY IT!

Then we will go outside our for loop and add the same code we used to create the top layer, in order to create our bottom layer.

In order to make our design look nicer, let's try making our box look different.

Rearrange the code below to make it produce the resulting image above.(Hint: Don't forget to indent your code)

```
def InBox(x):

x=(["Movie Recommendations"]+x)

biggest = max(x, key = len)

biggest=len(biggest)

print("+" + "-" * (biggest + 2) + "+")

for i in x:

    print("| " + i + (" "*(biggest-len(i)))
    + " |")

    print("+" + "-" * (biggest + 2) + "+")
```

Check It!

Before going on improve your code in the `moflix.py` file for your box to look nicer.

TRY IT!
