A Simple Chatbot in Python

The bot response function

The `bot_response` function is the logic function for the chatbot. This is where we will define the rules that the chatbot will follow to respond to `user_input`

Paste the following code in the top left pane, right below the import statements:

```
# Generating response
def get_bot_response(user_input):

    bot_response = ""
    if(user_input == "hello"):
        bot_response = "Hi!"
    elif(user_input == "hi" or user_input == "hii" or user_input == "hiiii"):
        bot_response = "Hello there! How are you?"
    elif(user_input == "how are you"):
        bot_response = "Oh, I'm great! How about you?"
    elif(user_input == "fine" or user_input == "i am good" or user_input == "i am doing good"):
        bot_response = "That's excellent! How can I help you today?"
    else:
        bot_response = "I'm sorry, I don't understand..."

    return bot_response
```

Code

This was the last step! We have successfully built our first chatbot! Let's run it and interact with it!

RUN CHATBOT

You might need to refresh, your lower left panel.

Limitations of this chatbot

This was a simple example of a hard-coded chatbot. This doesn't use any NLP concepts and does simple string matching to generate responses.

Re-arrange the blocks below to create a working `get_bot_response` function.

Remember indentation matters! Indent a code block by dragging it to the right.

def get_bot_response(user_input):

bot_response = ""

if(user_input == "How was your day?"):

bot_response = "It was great!"

elif(user_input == "hi" or user_input == "hey" or user_input == "hello"):

bot_response = "Hello there! How are you?"

else:

bot_response = "I'm sorry, I don't understand..."

return bot_response

The first step is the function definition and initializing the `bot_response` variable. Next, we start our conditionals, in the following order, and finish by returning the `bot_response` :

```
def get_bot_response(user_input):
    bot_response = ""
    if(user_input == "How was your day?"):
        bot_response = "It was great!"
    elif(user_input == "hi" or user_input == "hey" or user_input == "hello"):
        bot_response = "Hello there! How are you?"
    else:
        bot_response = "I'm sorry, I don't understand..."
    return bot_response
```

Check It!

Let's see how we can make this better by using the GPT-3.
