Instructions

This quiz will use the Coursera Lab Jupyter notebook "Lab to implement the linear Kalman filter" from this lesson.

In another browser tab or window, open the lab. Run the lab and enter results from the lab as your responses to the questions in this practice quiz.

1. What is the velocity-estimation error at the final timestep ($t = 100$)? Recall that error is a signed value and is calculated as "true velocity minus estimated velocity". Enter your answer with three digits to the right of the decimal point.

1 / 1 point

0.0020675

Correct
Yes. That is correct.

2. What is the 3σ bound on the velocity error at the final timestep? Enter your answer with three digits to the right of the decimal point.

1 / 1 point

0.0074352

Correct
Yes. That is correct.

3. During the simulation, how many times did the magnitude of the position error exceed the 3σ bounds on position error?

1 / 1 point

0

Correct
Yes. That is correct.
