Pre-Requisite Course Knowledge

Prior coding or scripting knowledge is required. We will be utilizing Python extensively throughout the course. In this course, you will need to have a solid foundation in Python or sufficient previous experience coding with other programming languages to pick up Python quickly. In the sequence's previous Supervised and Unsupervised learning courses, we worked extensively with data science libraries like NumPy, Pandas, Matplotlib, and Scikit-learn. The assignments in this course will expect that you are comfortable with those libraries and Jupyter notebooks. This course will familiarize Keras, a Python interface for neural networks. College-level math skills, including Calculus and Linear Algebra, are required. Some parts of the class will be relatively math intensive. Experience with Markdown and LaTeX are helpful but can be picked up as you work through the assignments. Previous experience working programmatically with image data would be beneficial but not necessary.
