

Easiest way to download kaggle data in Google Colab

Please follow the steps below to download and use kaggle data within Google Colab:

- Go to your account, Scroll to API section and Click **Expire API Token** to remove previous tokens
- Click on **Create New API Token** - It will download kaggle.json file on your machine.
- Go to your Google Colab project file and run the following commands:

```
2) ! pip install -q kaggle
from google.colab import files
files.upload()
• Choose the kaggle.json file that you downloaded

3) ! mkdir ~/kaggle
cp kaggle.json ~/kaggle/
• Make directory named kaggle and copy kaggle.json file there.

4) ! chmod 600 ~/kaggle/kaggle.json
• Change the permissions of the file.
```

That's all ! You can check if everything's okay by running this command.

Download Data

```
kaggle competitions download -c 'name-of-competition'
```

Use unzip command to **unzip the data**

For example,

Create a directory named train

```
mkdir train
```

unzip train data there,

```
unzip train.zip -d train
```

Additionally, you can also use the `-p` option with the `unzip` command to specify the destination directory. For example, `! unzip train.zip -d train -p`. This will directly extract the files to the destination directory without creating any additional subdirectories.

You can also use the `-q` option to suppress the verbose output and make the unzipping process faster. For example, `! unzip -q train.zip -d train -p`.

Another tip, it's always a good practice to check the size and content of the downloaded data before you proceed further. You can use the command `! ls -lh train` to check the size of the files in the train directory and `! ls -lh train/*` to check the content of the files inside the train directory.

after running command "`! kaggle competitions download -c 'name-of-competition'`" it is generating Error 403: forbidden

how to resolve it

LooseTerrifyingSpaceMonkey Posted 3 months ago

If you placed the kaggle.json file in the correct place, then the command you need to run is something like:

```
!kaggle competitions download -c 'titantic'
```

Also, you need to go to the competition and accept the terms.

You got to first accept the rules of the competition.

I can't unzip the train folder to my google colab with this command. I got this error. unzip: cannot find or open train.zip, train.zip.zip or train.zip.ZIP.

Make sure the file you downloaded is actually called `train.zip`. It could have another name such as `anythingelse.zip`. If you want to see what is available in the directory you are in you can run a cell with `!ls` to list the contents.

The line "I kaggle competitions download -c 'name-of-competition'" is downloading competition dataset.

But how about downloading my personal dataset?

Just paste these two code blocks and it should do!

```
from google.colab import files
files.upload()      # expire any previous token(s) and upload recreated token
```

The below code removes any file and delete `.kaggle` directory, move the uploaded token to a newly created directory and finishes off.

```
!rm -r ~/.kaggle
!mkdir ~/.kaggle
!mv ~/.kaggle.json ~/.kaggle/
!chmod 600 ~/.kaggle/kaggle.json
!kaggle datasets list
```

If you are having problems (i.e. it doesn't download all the dataset) with an outdated version of the Kaggle API, just run:

```
!pip install --upgrade --force-reinstall --no-deps kaggle
```

To download and unzip the dataset in one go:

- you can copy the required dataset URL suffix which is found after "kaggle.com/". Let's call it *url_suffix* here
- OR just click the kabab menu beside the *download* button from the dataset page and click copy the API command.

Then run the below line to download it into the *sample_data* Colab folder:
