Fashion-MNIST Dataset

In this week's assignment, we are using the ***Fashion-MNIST dataset***.

We worked with handwritten digit classification with the famous MNIST dataset in the Supervised Learning course. <http://yann.lecun.com/exdb/mnist/>

The MNIST dataset has long been used to benchmark machine learning algorithms. There has been some focus on replacing MNIST since advancements in machine learning algorithms make it too easy of a task. There is talk that it is over-used and incapable of representing current computer vision tasks. You can read more about it here if you are interested:

<https://github.com/zalandoresearch/fashion-mnist>

The Fashion-MNIST dataset has 60,000 training fashion images with 10,000 test images. The images are labeled with ten classes. ***Each grayscale image is 28x28, so 784 pixels***. Fashion-MNIST can be used to replace the original MNIST dataset since the images are the same size, and the datasets have the same training/testing split.
