

Module 1 Summary

After completing all of the materials, please take a moment to reflect on what was covered. The learning objectives below capture the key takeaways from this module:

- Understand the concept of Bayes' rule and how it is used in statistical inference.
- Define the general notation for statistical inference.
- Use the three steps of Bayesian data analysis: specifying a prior probability distribution, observing data, and updating the prior distribution with the observed data.
- State the basic framework of computation in Bayesian inference.
