

Module 2 Summary

After completing all of the materials, please take a moment to reflect on what was covered. The learning objectives below capture the key takeaways from this module:

- Estimate probabilities from binomial data.
- Understand the posterior distribution as a compromise between data and prior information.
- Summarize and interpret posterior distributions.
- Differentiate between informative, noninformative, and weakly informative priors.
- Understand the use of the normal distribution with known variance in Bayesian inference.
- Explore various standard single-parameter models and their applications.
