Correct
The result yields a posterior distribution of the form $\theta(1-\theta)^9 [1 + 8\theta + 36\theta^2]$

Your grade
To pass you need at least 80%. We keep your highest score.

2. Suppose you have a Beta(2, 2) prior distribution on θ .

posterior density (up to a proportionality constant)

☐ Beta(3,3)

☐ A distribution distinct from a beta distribution

✔ Correct

3. Why do we use conjugate priors in Bayesian inference?

1 / 1 point

- They simplify the mathematical process of updating the posterior distribution

☐ They incorporate more prior knowledge than nonconjugate priors

They assume the likelihood function is always normally distributed

☐ They are always more accurate than nonconjugate priors.

 Correct

Correct! Conjugacy is used to simplify the process of computing the posterior distribution.
