

Module 3 Summary

After completing all of the materials, please take a moment to reflect on what was covered. The learning objectives below capture the key takeaways from this module:

- Understand the concept of averaging over nuisance parameters in Bayesian analysis.
- Analyze normal data using noninformative prior distributions.
- Analyze normal data using conjugate and semi-conjugate prior distributions.
- Understand and apply the multivariate normal model with known variance.
- Analyze logistic regression models.
- Apply Bayesian methods to complex real-world problems.
