Simulation Techniques for Bayesian Inference Quiz

Instructions

Review Learning Objectives

1. Why might we use importance resampling?

1 / 1 point

- ☒ To convert weighted samples into unweighted samples.
- ☐ To avoid the use of MCMC.
- ☐ To simplify the posterior distribution.
- ☐ To generate dependent samples.

☐ Correct

Assignment details
Correct: Importance resampling converts weighted samples into unweighted samples, facilitating further analysis.

1/3 (max)

☐ Retry

2. What is a benefit of sampling without replacement in importance resampling?

1 / 1 point

- ☐ It increases computational efficiency.
- ☒ It provides a more desirable approximation between the starting and target densities.
- ☐ It avoids the need for prior distributions.
- ☐ It ensures all weights are equal.

☐ Correct

Assignment details
Correct: Sampling without replacement yields a more desirable intermediate approximation between the starting and target densities.

3. What is rejection sampling?

1 / 1 point

- ☒ A method to draw samples from an easy-to-sample distribution and reject some to match the target distribution.
- ☐ A method to ensure all samples are accepted.
- ☐ A method that avoids using a target distribution.
- ☐ A method that always improves computational efficiency.

☐ Correct

Assignment details
Correct: Rejection sampling involves drawing samples from a proposal distribution and accepting or rejecting them to match the target distribution.
