

Module 7 Summary

After completing all of the materials, please take a moment to reflect on what was covered. The learning objectives below capture the key takeaways from this module:

- Understand the basics of conditional modeling and Bayesian analysis of classical regression.
- Explore the goals and practical aspects of regression analysis, including regularization and handling unequal variances.
- Understand and apply standard generalized linear model likelihoods.
- Learn to work with generalized linear models and handle complex data scenarios like multivariate responses and overdispersion.
