1. What is the primary purpose of using finite mixture models? **1 / 1 point**

- To ensure all data follows a single normal distribution
- (•) To model data arising from multiple subpopulations
- To eliminate the need for any prior knowledge
- To simplify the data analysis process

Correct
Correct! Finite mixture models are used to model data that come from multiple subpopulations.

2. In the context of finite mixture models, what is the role of unobserved indicators? **1 / 1 point**

- They are used to estimate the variance of the model
- (•) They specify the mixture component from which each observation is drawn
- They represent the observed data
- They simplify the hierarchical model

Correct
Correct! Unobserved indicators are used to specify which mixture component each observation comes from.

3. What distribution is commonly assumed for the vector of mixture indicators in a finite mixture model? **1 / 1 point**

- Poisson distribution
- Exponential distribution
- (•) Multinomial distribution
- Normal distribution

Correct
Correct! The mixture indicators are often modeled as multinomial.
