Mixtures model . Quiz

David Gordo Learner 5 years ago

I don't understand the first question of the mixtures models quiz (honor track, week4). What it has to do with mixture models?

Do we have to use the model of Lesson10 or create a new one using mixtures?

Also, I don't get the correct answer, can anyone tell me what are the mean values of the fitted coefficients b_0 , $b[1]$ and $b[2]$. I suppose that this is not against the honors code, since it is not the answer, but allows me to know if the problem is related to the fitting or to the predicting phase.

Thanks everyone, and happy learning!

i use the model on quiz 10. the mean for $b.age = -0.0643688$, $b.group2=1.5463290$, $intercept=-2.5908443$

Thanks a lot Mahendri, that was the issue. I had the model priors set to be $N(0, 1/10^2)$, since in Jags the second parameter is the inverse of the variance.

Now it's settled :)
