

Module 4 assignments and materials

Assignments

This module has three required quizzes and an honors quiz. A score of 75% is required to pass (80% for the honors quiz). Quizzes can be attempted up to four times in an eight-hour period.

Additional Materials

In addition to regular lectures and quizzes, this module includes the following materials.

Lesson 10: Poisson Regression

- Prior sensitivity analysis: This optional (but strongly recommended) reading introduces prior sensitivity analysis, a topic that applies broadly in Bayesian analyses.
- Code: This document contains the development for the screen-recording lectures, including the code used in the examples.

Lesson 11: Hierarchical Modeling

- Normal hierarchical model: This optional reading demonstrates how the hierarchical model formulation allows for correlated/grouped observations, using the normal hierarchical model as an example.
- Applications of hierarchical modeling: This optional reading introduces a few areas of application for hierarchical models beyond their uses discussed in Lesson 11.
- Discussion prompt: Read what your peers have to say about the prompt and share your ideas on the discussion board.
- Code: This document contains the development for the screen recording lectures, including the code used in the examples.

Honors: Mixture Models

- Mixture model introduction, data, and code: This document introduces mixture modeling and contains the development for the screen-recording honors lecture, including code.
