

How to Add R to Jupyter Notebook (full steps)

February 25, 2022

You can add R to Jupyter Notebook by typing this command in the Anaconda Prompt:

```
conda install -c r r-irkernel
```

But just in case you were wondering, here are the full steps to add R to Jupyter Notebook from scratch.

Steps to Add R to Jupyter Notebook

Step 1: Open the Anaconda Prompt

To start, open the *Anaconda Prompt*.

You'll then see the following screen with your user name:

```
(base) C:\Users\Ron>
```

Step 2: Add R to Jupyter

Next, type/copy the following command in order to add R to Jupyter:

```
conda install -c r r-irkernel
```

The command would look like this in the Anaconda Prompt (press ENTER to proceed with the installation):

```
(base) C:\Users\Ron>conda install -c r r-irkernel
```

Next, type 'y' and then press ENTER to proceed:

```
Proceed ([y]/n)? y
```

After a short period of time, your installation would be completed.

Step 3: Launch Jupyter Notebook

To launch Jupyter Notebook, first open the **Anaconda Navigator**.

Then, click on the button to launch **Jupyter**.

Step 4: Create a new Notebook

To create a new Notebook for R:

1. First, click on **'New'** on the top right-hand-side of your screen
2. Finally, select **'R'** from the drop-down list

Step 5: Run your Code

You can now run your desired R code.

For example, you can create a simple [DataFrame in R](#) using this syntax:

```
df <- data.frame(product = c('Oven', 'Microwave', 'Toaster'),
                 price = c(850, 300, 120)
                 )
print (df)
```

Click on 'Run' and you'll get the following DataFrame:

```
   product price
1    Oven   850
2 Microwave   300
3   Toaster   120
```
