How are the models that we've used in this course so far (and in this specialization more broadly) based on the process of induction? Various models (e.g. linear regression, ANOVA, GLMs) are used to fit the data. We will need to evaluate our models by different approaches (e.g. R², residuals plot, QQ-plot). After we build our models by training dataset, we use test data set to further validate our data.	Did the student correctly identify how models used in this course are based on induction? 0 pts No Answer 4 pts The student attempted to answer the question, but the response does not demonstrate an correct understanding of induction. 6 pts The student correctly identified that our models are based on induction, but the answer contained some moderate errors. 8 pts The student correctly identified that our models are based on induction, but the answer contained some minor errors. 10 pts Yes, the student correctly identified that our models are based on induction, and gave specific examples and explanations.

"The fact that machine learning is 'evidence-based'" by no means ensures that it will lead to accurate, reliable, or fair decisions." Provide 2-3 examples of this claim. 1. Health care: Machine learning can assist doctors in diagnosing diseases. However, if the model is trained on data from younger individuals, it may encounter issues when applied to older patients. This is because the model might not generalize well to the characteristics or health conditions prevalent in older populations. 2. Bank: Banks use their risk evaluation systems to determine whether clients can obtain loans and how much they can borrow. Sometimes, these systems may be biased, especially if the client has only limited transaction records.	Did the student provide 2-3 examples? 0 pts No answer 3 pts The student provided inadequate examples, or only one example. 6 pts The student provided 2-3 examples.

Do you believe that Amazon's same-day delivery system mention on page 3-4 is unfair or unjust? Why or why not? Amazon's delivery system might be unfair because it gives different delivery options to neighborhoods based on race, even though this wasn't the company's intention.	Did the student answer the question and provide a justification for their answer? 0 pts No answer 4 pts The student answered the question but their justification had major gaps in reasoning. 6 pts The student answered the question but their justification had some gaps in reasoning. 8 pts The student answered the question and provided an adequate justification for their answer.

PROMPT	RUBRIC
What is the machine learning loop? Do you think that the machine learning loop, given in figure 1, applies to statistical modeling? Justify your answer. The machine learning loop includes data collection, establishing model, and get feedback, and then collect more data and refine the model. Yes, I think the machine learning loop applies to statistical modeling.	Did the student state what the machine learning loop is, and state and justify why they think it does (or does not) apply to statistical modeling? 0 pts No answer 4 pts The student correctly stated what the machine learning loop is, but did not state why they think it does (or does not) apply to statistical modeling. 7 pts The student correctly stated what the machine learning loop is, and stated why they think it does (or does not) apply to statistical modeling, but the justification was lacking. 10 pts The student correctly stated what the machine learning loop is, and stated and justified why they think it does (or does not) apply to statistical modeling.
