○ B=

0.5

✓ **Correct**
Correct, every circle through the triangle vertices does not contain any other vertex.

2. Given a point p inside a Delaunay triangle a, b, c , is the closest vertex in the Delaunay graph always one of a, b or c ? 1 / 1 point

☐ Yes, this is always the case.

☒ No, this is not always the case.

✔ Correct
Correct

3. Consider the Delaunay graph $|\mathcal{D}\mathcal{G}|$ as defined in the video lectures. The Gabriel graph $|\mathcal{G}\mathcal{G}|$ of a set P of points in the plane is defined as follows: two points p and q are connected by the edge of the Gabriel graph if and only if the circle with diameter pq does not contain any other point of P in its interior. A Euclidean minimum spanning tree $EMST$ of a point set P in the plane is a tree of minimum total edge length connecting all the points. A nearest neighbor graph $|\mathcal{N}\mathcal{N}\mathcal{G}|$ of a point set P in the plane is a directed graph containing for each point $p \in P$ a directed edge to a nearest neighbor in $P \setminus \{p\}$, i.e., as we define the graph, it contains exactly one outgoing edge per point. Given these definitions, which of the following is correct?

- ⊙ $NNG \subseteq EMST \subseteq GG \subseteq DG$
- $EMST \subseteq NNG \subseteq DG \subseteq GG$
- $EMST \subseteq GG \subseteq NNG \subseteq DG$

Correct
Correct
