# External lab: trigger inaccuracy in a model

In this external lab you will use a hosted chat service like [ChatGPT](#)  or [Claude](#)  and attempt to trigger an inaccuracy.

Triggering an inaccurate response from a language model can be tricky if you've never tried to do so intentionally. Understanding how to trigger one and what are some of the challenges with providing information is critical to work with Generative AI in a responsible way.

Note: Newer versions of these chat services will have guards against this problem so this might be difficult to trigger correctly.

## Steps

1. Use one of the hosted services for chatting
2. Attempt to ask about a recent event or produce information about an individual
3. Verify the responses against factual information you can use to corroborate for accuracy
