Foundation models and the next era of AI

In this article from Microsoft's blog, [🔗](#) you will go through the background on Foundation Models and how we've experienced a generational jump in capabilities from these large language models.

Reflection Questions

1. What key innovations in model architecture, scale, and training approaches have driven recent leaps in generative AI capabilities? How have models like GPT-3 and ChatGPT built upon previous work?
2. As foundation models rapidly solve existing benchmarks, how can progress in generative AI continue to be measured and evaluated? What new approaches are needed?
3. What are some real-world applications of large language models so far? What limitations around reliability, accuracy, and provenance need to be considered when applying these models?
