# Next steps

You've completed a full course on using, enhancing, and interacting with Large Language Models with a strong foundation on the basics of Generative AI. In this reading, you will find other Coursera content that you can explore, organized by topics.

This course is part of the LLMOps specialization [↗](#) which explores more scenarios with Large Language Models like using the Azure or AWS clouds, and using Open Source models.

Take the next steps in working more with programming languages like Python or Rust, and do more concrete and actionable work and projects by completing full courses or specializations.

## Machine Learning

- [Python Fundamentals](#) [↗](#): Introductory course to using Python, that helps you deploy a container to Azure as the last step
- [MLOps tools: MFlow and Hugging Face](#) [↗](#): Uses the most popular tools for deploying and consuming Machine Learning Models

## Data Engineering

- [Python and Pandas for Data Engineering](#) [↗](#): Explores the basics of Pandas with Python in this foundational course
- [Scripting with Python and SQL for Data Engineering](#) [↗](#): From loading data in different formats to doing web scrapping at scale, this course will help you grasp foundational data engineering with SQL and Python
- [Web applications and Python Command Line Tools](#) [↗](#): Create powerful web services and APIs as well as Command Line tools with Python

## DevOps

- [Python and Rust Command Line Tools](#) [↗](#): Dive deep into creating powerful automation with both Python and Rust with equal examples for both. From beginner to intermediate level.

## Other Programming Languages

- [Rust Fundamentals](#) [↗](#): The foundational course for Rust, made for beginners but will get you to a solid starting point in one of the fastest growing languages out there.
- [Rust for DevOps](#) [↗](#): Focuses on DevOps best-practices but using the Rust programming languages. Logging, monitoring, deployments, and automation. All covered and all using Rust
