

Additional Resources for Registration

Using **imregister** to align medical volumes is a good first approach to registering 3D images. However, there are many other approaches. This [documentation page](#)  lists other common approaches supported in MATLAB.

If you need to register 2D images, we recommend using the Registration Estimator App. The next video is from our [Introduction to Computer Vision course](#) . We recommend enrolling in the course if you need to register 2D images. While you don't need a deep understanding of concepts like image features to use the app, some knowledge will help you explore the various settings more effectively.
