

Introduction to Segmentation

In this Module, you'll use the Medical Image Labeler app to segment a brain MRI image into the left and right hemispheres. The app includes many tools to help you segment individual slices. Some of these tools use common image segmentation techniques like adaptive thresholding, dialation, and erosion.

The next two videos are from our [Image Processing for Engineering and Science Specialization](#) . You do not need this content to complete the course, but it will help you use the Medical Image Labeler app more effectively. To gain more hands-on practice with these techniques, we recommend enrolling the Image Processing for Engineering and Science Specialization.
