

The correct answer is:

Utilizing regular expressions

Explanation:

A key function of chat models when generating and extracting specific data is to use regular expressions (regex). Regex allows the model (or associated code) to identify, extract, and manipulate structured patterns in text, such as:

- Dates (\d{4}-\d{2}-\d{2})
- Email addresses (\w+@\w+\.\w+)
- JSON fields or specific keywords

This is commonly used in **data extraction tasks** within LangChain and other LLM-based pipelines.
