Module 3
Graded Assignment • 30 min

Due Nov 16, 11:59 PM IST

Your grade: 100%

Your latest: **100%** • Your highest: **100%** • To pass you need at least 70%. We keep your highest score.

Next item

1. The value in each edit-distance matrix element depends on its neighbors: 1 / 1 point

Nice work

2. Say we have filled in the approximate matching matrix and identified the minimum value (say, 2) in the bottom row. Now we would like to know the shape of the corresponding 2-edit alignment, i.e. we would like to know where the insertions, deletions and substitutions are. We use a procedure called: 1 / 1 point

Nice work

3. Say the edit distance between DNA strings α and β is 407. What is the edit distance between α and β**G** (β concatenated with the base **G**)? 1 / 1 point

Nice work

4. Say we are using dynamic programming to find approximate occurrences of P in T. About how many dynamic programming matrix elements do we have to fill in? 1 / 1 point

Nice work

5. Local alignment is different from global alignment because: 1 / 1 point

Nice work

6. The first law of assembly says that if a prefix of read A is similar to a suffix of read B, then... 1 / 1 point

Nice work

7. The second law of assembly says that more coverage leads to... 1 / 1 point

Nice work

8. In an overlap graph, the nodes of the graph correspond to 1 / 1 point

Nice work

9. The overlap graph is a useful structure because: 1 / 1 point

Nice work

10. Which of the following is not a reason why an overlap might contain sequence differences (i.e. might not be an exact match): 1 / 1 point

Nice work
