How to replace elements in a NumPy array if a condition is met in Python

Replacing elements in a NumPy [array](#) if a condition is met replaces each element in the array that satisfies the given condition with another value.

USE `numpy.where()` TO REPLACE ELEMENTS OF AN ARRAY THAT SATISFY A CONDITION

Call `numpy.where(condition, x, y)` to replace values that meet condition with x, and those that do not with y.

```
print(an_array)
```

OUTPUT

```
[ 3 23  5 67 12 15 89]
```

```
an_array = np.where(an_array > 20, 0, an_array)
```

```
print(an_array)
```

OUTPUT

```
[ 3  0  5  0 12 15  0]
```
