1. What function in Pandas can be used to read a CSV file into a DataFrame?

1 / 1 point

- ☐ import_csv()
- ☒ read_csv()
- ☐ get_csv()
- ☐ load_csv()

✔ Correct
Correct! The read_csv() function is used to read a CSV file into a DataFrame in Pandas.

2. In the context of a fully connected GAN generator, which of the following layers are typically included?

1 / 1 point

- ☐ Normalization layer
- ☒ Input layer
- ☒ Output layer
- ☐ Pooling layer
- ☒ Hidden layers

✔ Correct
Correct! The input layer is where the random noise vector is fed into the generator.

✔ Correct
Correct! The output layer generates the final fake image.

✔ Correct
Correct! Hidden layers are used to transform the input data into a meaningful output.

3. Which of the following steps are involved in defining a function to create a fully connected layer generator using Python and Keras?

0.6 / 1 point

- ☒ Importing necessary libraries
- ☒ Defining the input shape

✔ Correct
Correct! You need to import libraries such as TensorFlow and Keras.

✔ Correct
Correct! Defining the input shape is crucial for creating the generator.

- ☒ Adding dropout layers to prevent overfitting

✘ This should not be selected
Incorrect. While adding dropout layers can be beneficial, it is not a necessary step for defining the generator.

- ☐ Setting up callbacks for model checkpoints
- ☐ Compiling the model with an optimizer

4. Which activation function is commonly used in the discriminator model of a GAN to introduce non-linearity?

1 / 1 point

- ☒ sigmoid
- ☐ tanh
- ☐ ReLU
- ☐ softmax

✔ Correct
Correct! The sigmoid activation function is commonly used in the discriminator model to introduce non-linearity.

5. What is the key purpose of the discriminator in a fully connected GAN?

1 / 1 point

- ☐ To optimize the generator model
- ☐ To generate new images
- ☒ To classify input as real or fake
- ☐ To reduce the dimensionality of input data

✔ Correct
Correct! The discriminator's purpose is to classify whether the input is real or generated (fake).
