1.

Which of the following steps is essential for improving the quality of generated images in GANs?

1 / 1 point
- ☐

Ignoring the loss function values during training.

☐

Using a fixed dataset without any augmentation.

☒

Regularly updating the discriminator and generator networks.

☐

Decreasing the batch size progressively during training.
- 

Correct
Exactly! Regular updates ensure that both networks improve over time, leading to better quality images.

2.

What is the primary difference between a normal GAN and a conditional GAN (cGAN)?

1 / 1 point

☐

cGANs are used only for text generation.

☐

cGANs do not use a discriminator network.

☒

cGANs generate images conditioned on additional information like class labels.

☐

cGANs do not use a generator network.

Correct
Correct! Conditional GANs (cGANs) use additional information to generate specific images.

3.

Which of the following statements are true about cGANs?

1 / 1 point

☒

cGANs are a type of GAN.

Correct
Correct! cGANs are an extension of the standard GAN architecture.

☐

cGANs do not require a generator network.

☒

cGANs use additional information to guide image generation.

Correct
Correct! cGANs leverage extra information to control the image generation process.

☐

cGANs are used exclusively in unsupervised learning.

4.

Which aspects must be considered to implement an effective Conditional GAN?

1 / 1 point

☐

The difference between training and testing datasets

☒

Quality of the generated data samples

Correct
Correct! The quality of generated data samples is a key aspect of an effective Conditional GAN.

☐

The size of the output data samples

☒

Appropriate conditioning on labels

Correct
Correct! Ensuring appropriate conditioning on labels is essential for the effectiveness of a Conditional GAN.

☒

Stability of the training process

Correct
Correct! The stability of the training process is crucial for any GAN, including Conditional GANs.

5.

Which of the following steps are involved in converting a fully connected GAN into a Conditional GAN?

1 / 1 point

☐

Adding an additional layer to the discriminator

☒

Concatenating labels with the input noise vector

Correct
Correct! This is a crucial step in converting a fully connected GAN into a Conditional GAN.

☒

Modifying the generator to accept additional input

Correct
Correct! The generator must be modified to accept labels as additional input.

☐

Concatenating labels with the discriminator output

☐

Changing the activation functions in the generator
