

To validate Module 2 and correctly answer the questions will require that you perform the following exercise first: take the code in the file named module2.R, and modify it such that the managerial segment "new active" is divided into two sub-segments called "new active high" (with an average purchase amount of \$100 or more) and "new active low" (with an average purchase amount of less than \$100). Tips: make sure that you apply that modification to both the 2015 and 2014 segmentations, and that you modify accordingly the code that re-order the factor "segment".

**You'll be asked to answer these questions :**

How many "new active low" customers were there in 2015?

The number of "new active high" customers has increased between 2014 and 2015. What is the rate of that increase?

Regarding the customers who belonged to the "new warm" segment in 2014, what was there expected revenue, all things considered, in 2015?

In terms of expected revenue, which segment groups the least profitable customers?

Looking at segment description, what is the average purchase amount of a customer who belongs to the "new active high" segment?
