Assignment: Peer Review

Submit by February 14, 11:59 PM PT

Important Information

It is especially important to submit this assignment before the deadline, February 14, 11:59 PM PT, because it must be graded by others. If you submit late, there may not be enough classmates around to review your work. This makes it difficult - and in some cases, impossible - to produce a grade. Submit on time to avoid these risks.

Instructions

This deliverable objective is to be a first draft of one of the first slides of your presentation for the capstone project. This one-pager needs to describe what your project will be addressing. It may be a « pain point » to solve, or an opportunity to take. But it needs to be relevant, visual, self-contained, and clear.

Instructions

less ^

For this last exercise of this course, we would like you to practice a qualification issue on actual data. And we'll kill two birds with one stone, by already preparing the capstone project of this specialisation.

We've prepared a list of datasets (<http://bit.ly/1F9YKSD>) that you can work on. You'll find a documentation describing those datasets and some propositions of issues that could be addressed. Note that if you find more interesting datasets or questions, you should feel free to use it as long as the data is accessible to everybody. The objective is that any other participant may decide to replicate the results of another participant. That's why all the datasets that we list are open source...

So, for the end of this course, we would like you to already prepare the first slide of your capstone project presentation. It may be a « pain point » to solve, or an opportunity to take. This is an issue qualification problem. Not a question where there is a problem to solve or a correct answer to find... This one page needs to be relevant, visual, self-contained, and clear. In short, everything we emphasized in the module 5.

The document needs to be one page long maximum with a font size of 12 minimum. Please provide a pdf as this will ensure that there will be no versioning problem. Make sure that all the content of your slide is readable and well presented.

In order to begin the data investigation process, you can first start replicating the different analyses discussed during the course on your own data set: can you find groups of similar or dissimilar observations? Can you find relationships between causes and consequences? Always try to produce some visuals as we did during the videos... You'll probably notice patterns that are relevant or surprising. This may lead to relevant opportunities to take or problems to solve. Also try to select a data set related to a business you are familiar with or that you can discuss with your friends or colleagues. Do not hesitate to interview people from this specific sector: they may be able to tell you what could be relevant to investigate... In any case, do not hesitate to ask questions on the forum and to discuss your ideas or insights with the other participants.

Review Criteria

less ^

You will then be assessed by your peers based on 4 criteria. Each time assessed on a scale of 1 to 5, 1 being very bad, and 5 being very good:

- Relevance: How relevant is the issue raised for a business or an organization?
- Presentation: How well is the issue presented, in a visual and quantitative way?
- Level of information: Is it the right level of information? Nor too much, neither too little?
- Structure: Is the slide well structured? Do we have a hierarchy of information that allows to read the slide at different level of depth?

When you will evaluate your peers, you will be asked to motivate your assessment by indicating:

- 3 "attention points" that you think should have been improved with regard to this criterion
- 3 "strengths" of the deliverable with regard to this criterion

You need to present the situation emphasizing the pain point or opportunity in a data-based and visual way. You don't need to produce any advanced analysis or conclusion yet, but the presentation of the problem needs to be factual, relevant and visual. For instance, in the case of the HR Analytics example, a figure reporting the defection would be relevant. Another example, in the predictive maintenance case, would be to report the number of broken elements and to emphasize what would be the expected benefit of a prediction analysis. It's the relevance of the issue that needs to be emphasized, not the analyses or the conclusions yet...

This is an issue qualification problem. Not a question where there is a problem to solve or a correct answer to find
