2. Which of the following best describes the process of deriving knowledge, insights, and patterns from real-world phenomena? Submitted

Data science primarily involves collecting data without analyzing it.

Data science involves methods of acquisition, storage, and analysis of data to effectively extract useful knowledge, information, insights, and patterns.

Data science is solely concerned with the extraction of insights.

Data science relies solely on domain-specific knowledge without utilizing data analysis techniques.

Correct

Data science encompasses the entire process of acquiring, storing, and analyzing data to derive meaningful insights and patterns from real-world phenomena. It involves various methods and techniques to effectively handle data, including acquisition, storage, and analysis, in order to extract valuable information and insights.

3. Data science can be applied to which of the following situations? 1 / 1 point

Marketing analytics

Medical diagnoses

Political election predictions

All of the above, since data science can be applied to any problem for which you can acquire, store and analyze data

Correct
